Typically, the greatest how comes comes from 2-6" or so of flood. More, residents wreck/demolished the house; less no big deal. USACE may have changed their segregation before debris collection

FEMA is reporting their estimate on damage to houses...

56,269 affected

43,118 minor

13,986 major

6,475 destroyed

119,848 total

Based on my almost perfect estimate of HHW from Katrina, we can expect 100 pounds of HHW from at least the houses that have major or destroyed damage... which would about 1.9 million pounds of HHW...

If you include the minor damaged houses, the amount would go up to approximately 6.3 million pounds of HHW...

We collected over 23 million for Katrina...

With Regards, Steve
